Data Subject to Change Without Notice

These guidelines have been formulated to ensure proper application of generator drive engines in A.C. generator set nstallations. **STANDBY POWER RATING:** Applicable for supplying emergency power for the duration of the utility power usinge. No overload capability is available for this rating. Under no condition is an engine allowed to operate in parallel with the public utility at the Standby Power rating. This rating should be applied where reliable utility power is available for this rating. Under no condition is an engine allowed to operate in parallel with the public utility at the Standby Power rating. This rating should be applied where reliable utility power is available of or a Max of an 80% average load factor and 200 hours of operation per year. This noticudes less than 25 hours per year at the Standby Power rating. Standby ratings should never be applied except in true emergency power outages. Negotiated power outages contracted with a utility company are not considered an emergency. **PRIME POWER RATING**; Applicable for supplying electric power in lieu of commercially purchased power. Prime Power papilications must be in the form of one of the following two categories: <u>UNLIMITED TIME RUNNING PRIME POWER</u>; Prim Power is available for an unlimited number of hours per year in a variable load application. Variable load should not exceed 70% average of the Prime Power rating during any operating period of 250 hours. The total operating time at 100% Prime Power shall not exceed 500 hours per year. A 10% overload capability is available for a proind of 1 hour within a 12-hour period of operation. Total operating time at the 10% overload capability is available for a unorwariable load application. It is intended for use in situations where power outages are contracted, such as in utility power cutaliment. Engines may be operated in parallel to the public utility up to 750 hours per year at power levels never to exceed the Prime Power rating. The customer should be aware, however, that the lif

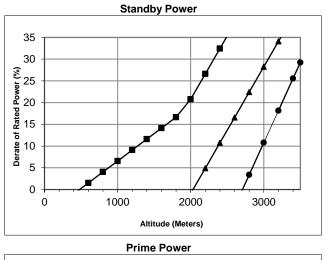

Data shown above represent gross engine performance capabilities obtained and corrected in accordance with ISO-3046 conditions of 100 kPa (29.53 in Hg) barometric pressure [110 m (361 ft) altitude], 25 °C (77 °F) air inlet temperature, and relative numidity of 30% with No. 2 diesel or a fuel corresponding to ASTM D2.

Derates shown are based on 8.83 in H2O air intake restriction and 2.54 in Hg exhaust back pres

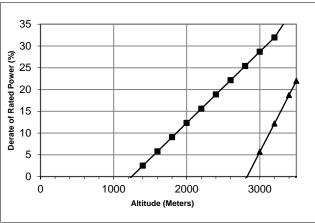

The fuel consumption data is based on No. 2 diesel fuel weight at 0.85 kg/L (7.1 lbs/US gal). Power output curves are based on the engine operating with fuel system, water pump and lubricating oil pump; not included are battery charging alternator, fan, optional equipment and driven components.

Data Status : Production Tolerance : +/- 5% Chief Engineer: Abhishek Mehrotra
